2 Meta Language

2.1 Raw Formulas

Formula	ϕ, ψ	::=	$t =_A u$
		|	$R(t, u)$
		|	$\phi \implies \psi$
		|	$\phi \wedge \psi$
		|	$\phi \vee \psi$
		|	$\exists x : A.\phi$
		|	$\exists X.\phi$
		|	$\exists \underline{X}.\phi$
		|	$\exists R : Rel[A, B].\phi$
		|	$\forall x : A.\phi$
		|	$\forall X.\phi$
		|	$\forall \underline{X}.\phi$
		|	$\forall R : Rel[A, B].\phi$

2.2 Typed Formulas

Propositions, or well-formed formulas, use a term environment Γ, type environment Δ and relation environment Θ. The typing judgement for Propositions is $\Delta;\Gamma;\Theta \vdash_p P$. There are value relations and computation relations.

$$\frac{\Delta;\Gamma \vdash_\_ t : A \qquad \Delta;\Gamma \vdash_\_ u : A}{\Delta;\Gamma;\Theta \vdash_p t =_A u} \text{ for } v, c$$

$$\frac{\Delta;\Gamma \vdash_\_ t : A \qquad \Delta;\Gamma \vdash_\_ u : B \qquad R : Rel_\_[A, B] \in \Theta}{\Delta;\Gamma;\Theta \vdash_p R(t, u)} \text{ for } v, c$$

$$\frac{\Delta;\Gamma;\Theta \vdash_p \phi \qquad \Delta;\Gamma;\Theta \vdash_p \psi}{\Delta;\Gamma;\Theta \vdash_p \phi \square \psi} \;\square \in \{\wedge, \vee, \implies\}$$

what about *? Something like exists fresh

$$\frac{\Delta;\Gamma, x : A|\Theta \vdash_p \phi}{\Delta;\Gamma;\Theta \vdash_p \exists x : A.\phi}$$

$$\frac{\Delta;\Gamma;\Theta \vdash_p \phi}{\Delta;\Gamma;\Theta \vdash_p \exists X.\phi} \; X \notin FV(\Delta, \Gamma, \Theta)$$

$$\frac{\Delta;\Gamma;\Theta \vdash_p \phi}{\Delta;\Gamma;\Theta \vdash_p \exists \underline{X}.\phi} \; \underline{X} \notin FV(\Delta, \Gamma, \Theta)$$

$$\frac{\Delta;\Gamma;\Theta, R : Rel\_[A, B] \vdash_p \phi}{\Delta;\Gamma;\Theta \vdash_p \exists R : Rel\_[A, B].\phi} \; \text{for } \{v, c\}$$

$$\frac{\Delta;\Gamma, x : A|\Theta \vdash_p \phi}{\Delta;\Gamma;\Theta \vdash_p \forall x : A.\phi}$$

$$\frac{\Delta;\Gamma;\Theta \vdash_p \phi}{\Delta;\Gamma;\Theta \vdash_p \forall X.\phi} \; X \notin FV(\Delta, \Gamma, \Theta)$$

$$\frac{\Delta;\Gamma;\Theta \vdash_p \phi}{\Delta;\Gamma;\Theta \vdash_p \forall \underline{X}.\phi} \; \underline{X} \notin FV(\Delta, \Gamma, \Theta)$$

$$\frac{\Delta;\Gamma;\Theta, R : Rel\_[A, B] \vdash_p \phi}{\Delta;\Gamma;\Theta \vdash_p \forall R : Rel\_[A, B].\phi} \; \text{for } \{v, c\}$$

2.3   Typed Relations

Relations are of the form $(x : A, y : B).\phi$ where ϕ is a proposition that can use x, y. The typing judgement for relations is $\Delta;\Gamma;\Theta \vdash_r (x : A, y : B).\phi : Rel\_[A, B]$. The body of the relation is a proposition. Here we pay attention to the difference between value and computation relations.

again, what about *?

$$\frac{\Delta;\Gamma, x : A \vdash_v t : C \qquad \Delta;\Gamma, y : B \vdash_v u : C}{\Delta;\Gamma;\Theta \vdash_r (x : A, y : B).t =_C u : Rel_v[A, B]}$$

secretly inserting stoup

$$\frac{\Delta;\Gamma|x : \underline{A} \vdash_c t : \underline{C} \qquad \Delta;\Gamma|y : \underline{B} \vdash_c u : \underline{C}}{\Delta;\Gamma;\Theta \vdash_r (x : \underline{A}, y : \underline{B}).t =_{\underline{C}} u : Rel_c[\underline{A}, \underline{B}]}$$

Given some $x : A$ and $y : B$ the terms t, u are related by R, thus we have a relation on A, B. Think of these like a lambda abstraction over two parameters. If the body is related, we can

$$\frac{\Delta; \Gamma, x : A \vdash_v t : C \qquad \Delta; \Gamma, y : B \vdash_v u : D}{\Delta; \Gamma; \Theta, R : Rel_v[C, D] \vdash_r (x : A, y : B).R(t, u) : Rel_v[A, B]}$$

$$\frac{\Delta; \Gamma | x : \underline{A} \vdash_c t : \underline{C} \qquad \Delta; \Gamma | y : \underline{B} \vdash_c u : \underline{D}}{\Delta; \Gamma; \Theta, \underline{R} : Rel_c[\underline{C}, \underline{D}] \vdash_r (x : \underline{A}, y : \underline{B}).\underline{R}(t, u) : Rel_c[\underline{A}, \underline{B}]}$$

What is the intuition here? This rule is in figure 5 of the PE logic paper.

$$\frac{\Delta; \Gamma; \Theta \vdash_p \phi \qquad \Delta; \Gamma; \Theta \vdash_r (x : A, y : B).\psi : Rel_v A, B}{\Delta; \Gamma; \Theta \vdash_r (x : A, y : B).\phi \implies \psi : Rel_v[A, B]} \text{ also } c \text{ version}$$

?

$$\frac{\Delta; \Gamma; \Theta \vdash ? \qquad \Delta; \Gamma; \Theta \vdash ?}{\Delta; \Gamma; \Theta \vdash_r (x : A, y : B).\phi \wedge \psi : Rel_v[A, B]} \text{ also } c \text{ version}$$

$$\frac{\Delta; \Gamma, z : C; \Theta \vdash_r (x : A, y : B).\phi : Rel_v[A, B]?}{\Delta; \Gamma; \Theta \vdash_r (x : A, y : B).\forall(z : C).\phi : Rel_v[A, B]} \text{ also } c \text{ version}$$

$$\frac{\Delta, X; \Gamma; \Theta \vdash_r (x : A, y : B).\phi : Rel_v[A, B]?}{\Delta; \Gamma; \Theta \vdash_r (x : A, y : B).\forall X.\phi : Rel_v[A, B]} \text{ also } c \text{ version}$$

$$\frac{\Delta, X; \Gamma; \Theta, R : Rel_{\mathbf{n}}[C, D] \vdash_r (x : A, y : B).\phi : Rel_{\mathbf{m}}[A, B]}{\Delta; \Gamma; \Theta \vdash_r (x : A, y : B).\forall(R : Rel_{\mathbf{n}}[C, D]).\phi : Rel_{\mathbf{m}}[A, B]} \mathbf{n}, \mathbf{m} \in \{v, c\}$$

Analogous versions for $\exists$ connectives.

2.4 Deduction Rules

The judgement for deduction sequence are of the form $\Delta; \Gamma; \Theta; \Phi \vdash_d \psi$ where Δ is a type environment, Γ is a term environment, Θ is a relation environment, Θ is a proposition environment, and ψ is a proposition. like term intro and elim, but without proof terms also for computations?

$$\frac{\Delta; \Gamma \vdash_v t : A}{\Delta; \Gamma; \Theta; \Phi \vdash_d t =_A t} \text{ refl}$$

$$\frac{\Delta; \Gamma; \Theta; \Phi \vdash_d t =_A u \qquad \Delta; \Gamma; \Theta; \Phi \vdash_d \phi[t/x]}{\Delta; \Gamma; \Theta; \Phi \vdash_d \phi[u/x]} \text{ subst}$$

$$\frac{\Delta; \Gamma; \Theta; \Phi, \phi \vdash_d \psi}{\Delta; \Gamma; \Theta; \Phi \vdash_d \phi \implies \psi} \implies \text{Intro}$$

$$\frac{\Delta;\Gamma;\Theta;\Phi \vdash_d \phi \implies \psi \qquad \Delta;\Gamma;\Theta;\Phi \vdash_d \phi}{\Delta;\Gamma;\Theta;\Phi \vdash_d \psi} \implies \text{Elim}$$

and familiar rules for logical and ($\wedge$)

$$\frac{\Delta;\Gamma,(x:A);\Theta;\Phi \vdash_d \phi}{\Delta;\Gamma;\Theta;\Phi \vdash_d \forall(x:A).\phi} \; \forall \text{ Term Intro}$$

$$\frac{\Delta;\Gamma;\Theta;\Phi \vdash_d \forall(x:A).\phi \qquad \Delta;\Gamma \vdash_v t:A}{\Delta;\Gamma;\Theta;\Phi \vdash_d \phi[t/x]} \; \forall \text{ Term Elim}$$

$$X \notin FV(..), \text{ also for } c \; \frac{\Delta,X;\Gamma;\Theta;\Phi \vdash_d \phi}{\Delta;\Gamma;\Theta;\Phi \vdash_d \forall X.\phi} \; \forall \text{ Type Intro}$$

$$\text{also for } c \; \frac{\Delta;\Gamma;\Theta;\Phi \vdash_d \forall X.\phi \qquad \Delta \vdash A}{\Delta;\Gamma;\Theta;\Phi \vdash_d \phi[A/X]} \; \forall \text{ Type Elim}$$

$$\text{also for } c \; \frac{\Delta;\Gamma;\Theta,R:Rel_v[A,B];\Phi \vdash_d \phi}{\Delta;\Gamma;\Theta;\Phi \vdash_d \forall(R:Rel_v[A,B]).\phi} \; \forall \text{ Rel Intro}$$

$$\text{also for } c \; \frac{\Delta;\Gamma;\Theta;\Phi \vdash_d \forall(R:Rel_v[A,B]).\phi \qquad \Delta;\Gamma;\Theta \vdash_r (x:A,y:B).\psi:Rel_v[A,B]}{\Delta;\Gamma;\Theta;\Phi \vdash_d \phi[\psi[t/x,u/y]/R(t,u)]} \; \forall \text{ Rel Elim}$$

2.5 Axioms & Axiom Schemas

2.5.1 Congruences

$$\frac{\Delta;\Gamma,(x:A) \vdash_c t,u:\underline{B} \qquad \Delta;\Gamma,(x:A);\Theta;\Phi \vdash_d t=u}{\Delta;\Gamma;\Theta;\Phi \vdash_d (\lambda(x:A).t) =_{A \to \underline{B}} (\lambda(x:A).u)} \; \lambda \text{ cong}, \; x \notin FV(\Phi)$$

2.5.2 Beta / Eta Laws

$$\frac{}{\Delta;\Gamma;\Theta;\Phi \vdash_d \forall(u:A).((\lambda x:A.t)u =_B t[u/x])} \; \lambda\beta$$

$$\frac{}{\Delta;\Gamma;\Theta;\Phi \vdash_d \forall X.\forall Y.\forall(f:X \to Y).((\lambda x:X.fx) =_{X \to Y} f)} \; \lambda\eta$$

2.5.3 Parametricity

2.6 Relational interpretation of Types

Let $\boldsymbol{X}$ and $\underline{\boldsymbol{X}}$ be vectors of value type and computation type variables of length n. Let $\boldsymbol{\rho}$ be a vector of value relations $\Delta;\Gamma;\Theta \vdash_r \rho_i : Rel_v[C_i, C_i']$ for all $i \in 1..n$. Let $\underline{\boldsymbol{\rho}}$ be a vector of computation relations $\Delta;\Gamma;\Theta \vdash_r \underline{\rho_i} : Rel_c[\underline{C_i}, \underline{C_i'}]$ for all $i \in 1..n$. Let A be a **value type** with $FTV(A) \in \{\boldsymbol{X}, \underline{\boldsymbol{X}}\}$. Define:

$$A[\boldsymbol{\rho}/\boldsymbol{X}, \underline{\boldsymbol{\rho}}/\underline{\boldsymbol{X}}] : Rel_v[A[\boldsymbol{C}/\boldsymbol{X}, \underline{\boldsymbol{C}}/\underline{\boldsymbol{X}}], A[\boldsymbol{C'}/\boldsymbol{X}, \underline{\boldsymbol{C'}}/\underline{\boldsymbol{X}}]]$$

by induction on A. Note: PE Logic defines the relational interpretation of value types, but not computation types? . It seems like this relation needs to be indexed by worlds to describe how Case A and OSum are related.

$$X_i[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}] = \rho_i$$

$$\mathrm{Unit}[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}] = (x : Unit, y : Unit).x =_{Unit} y$$

$$\mathrm{Case}A[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}] = \text{same injection}$$

$$\mathrm{OSum}[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}] = \text{same injection, related values}$$

$$A \times A'[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}] = ((x,y) : A \times A'[\boldsymbol{C}/\boldsymbol{X}, \underline{\boldsymbol{C}}/\underline{\boldsymbol{X}}], (x',y') : A \times A'[\boldsymbol{C'}/\boldsymbol{X}, \underline{\boldsymbol{C'}}/\underline{\boldsymbol{X}}]).$$
$$A[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}](x, x') \wedge A'[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}](y, y')$$

$$A * A'[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}] = \text{same as product.. but fiddle with world index?}$$

$$\exists X.A[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}] = standard$$

$$U\underline{B}[\boldsymbol{\rho}, \underline{\boldsymbol{\rho}}] = \text{related thunks?}$$

2.7 Example Derivations

2.7.1 Equality Reasoning

Transitivity

$$\cfrac{\cfrac{\cdots; (x =_X y) \wedge (y =_X z) \vdash_d y =_X z}{\cfrac{\cdots; (x =_X y) \wedge (y =_X z) \vdash_d (x =_X y) \wedge (y =_X z)}{\cdots; (x =_X y) \wedge (y =_X z) \vdash_d (x =_X y) \wedge (y =_X z)}} \quad \cfrac{\cfrac{\cdots; (x =_X y) \wedge (y =_X z) \vdash_d (x =_X y) \wedge (y =_X z)}{\cdots; (x =_X y) \wedge (y =_X z) \vdash_d (x =_X y)}}{\cdots; (x =_X y) \wedge (y =_X z) \vdash_d (x =_X y)[y/y]} \, \text{subst}}{\cfrac{X; x, y, z; \cdot; (x =_X y) \wedge (y =_X z) \vdash_d (x =_X y)[z/y]}{\cfrac{X; x, y, z; \cdot; (x =_X y) \wedge (y =_X z) \vdash_d (x =_X z)}{\vdash_d \forall X.\forall(xyz : X).(x =_X y) \wedge (y =_X z) \implies (x =_X z)}}}$$

Symmetry   Use IdExt and opRel?

2.7.2 Extensionality

$$\cfrac{\cfrac{\cfrac{\cfrac{\cfrac{\overline{X, \underline{Y}; f, g, x; \cdot; (\forall(x : X).fx =_{\underline{Y}} gx) \vdash_d \forall(x : X).(fx =_{\underline{Y}} gx)} \, \text{in } \Phi \quad \overline{\cdots \vdash_v x : X} \, \text{Var}}{X, \underline{Y}; f, g, x; \cdot; (\forall(x : X).fx =_{\underline{Y}} gx) \vdash_d (fx =_{\underline{Y}} gx)} \, \forall \text{ Elim}}{X, \underline{Y}; f, g; \cdot; (\forall(x : X).fx =_{\underline{Y}} gx) \vdash_d ((\lambda x : X.fx) =_{X \to \underline{Y}} (\lambda x : X.gx))} \, \lambda \text{ cong}}{X, \underline{Y}; f, g; \cdot; (\forall(x : X).fx =_{\underline{Y}} gx) \vdash_d (f =_{X \to \underline{Y}} g)} \, \lambda\eta}{X, \underline{Y}; f, g; \cdot; \cdot \vdash_d ((\forall(x : X).fx =_{\underline{Y}} gx) \implies f =_{X \to \underline{Y}} g)} \, \text{Intros}}{\cdots \vdash_d \forall(f, g : X \to \underline{Y}).((\forall(x : X).fx =_{\underline{Y}} gx) \implies f =_{X \to \underline{Y}} g)} \, \text{Intros}}$$

2.7.3 Identity Extension Lemma

By Induction on Types.

For Unit Recall

$$eq_A := (x : A, y : A).x =_A y$$

and substitution of a relation into a base type is just the relational interpretation of the base type.

$$Unit[eq_{Unit}] = [\![Unit]\!]_{Rel} = \{(tt, tt)\}$$

What rules are missing here to make this proof go through?

$$\cfrac{\cfrac{\cfrac{\cfrac{\overline{...;\Phi,\{u = tt, v = tt\} \vdash_d tt =_{Unit} tt}\ \text{Refl}}{...;\Phi, u([\![Unit]\!]_{Rel})v \vdash_d u =_{Unit} v}\ \text{Unit } \eta\ ?}{... \vdash_d u([\![Unit]\!]_{Rel})v \implies u =_{Unit} v}\ \text{Intro} \qquad \cfrac{\cfrac{\cfrac{\overline{...;\Phi, tt =_{Unit} tt \vdash_d tt([\![Unit]\!]_{Rel})tt}\ \text{By Def}}{...;\Phi, u =_{Unit} v \vdash_d u([\![Unit]\!]_{Rel})v}\ \text{Unit } \eta?}{... \vdash_d u =_{Unit} v \implies u([\![Unit]\!]_{Rel})v}\ \text{Intro}}{}\ \text{Logical Equiv}}{\cfrac{\cfrac{\cdot; u : Unit, v : Unit; \cdot; \cdot \vdash_d u([\![Unit]\!]_{Rel})v \equiv u =_{Unit} v}{\cdot; \cdot; \cdot; \cdot \vdash_d \forall u : Unit, v : Unit.u([\![Unit]\!]_{Rel})v \equiv u =_{Unit} v}\ \text{Intros}}{\cdot; \cdot; \cdot; \cdot \vdash_d \forall u : Unit, v : Unit.u(Unit[eq_{Unit}])v \equiv u =_{Unit} v}\ \text{Relational Subst}}$$

For $X \to \underline{Y}$ Recall

$$(X \to \underline{Y})[eq_X, eq_{\underline{Y}}] = (f : (X \to \underline{Y})g : (X \to \underline{Y})).$$
$$\forall(x : X).\forall(x' : X).$$
$$x(eq_X)x' \implies (fx)(eq_Y)(gx')$$

One direction.

$$\cfrac{\cfrac{\cfrac{\cfrac{\overline{\text{(the relation in above on } f, g)}\ \text{in } \Phi}{.. \vdash_d \forall(x' : X).x(eq_X)x' \implies fx =_{\underline{Y}} gx'} \quad \cfrac{\overline{.. \vdash_v x : X}\ \text{Var}}{}\ \forall\ \text{Elim}}{..; f((X \to \underline{Y})[eq_X, eq_{\underline{Y}}])g \vdash_d x(eq_X)x \implies fx =_{\underline{Y}} gx} \quad \cfrac{\overline{.. \vdash_v x : X}\ \text{Var}}{}\ \forall\ \text{Elim} \quad \cfrac{\cfrac{\overline{\vdash_d x =_X x}\ \text{Refl}}{\vdash_d x(eq_X)x}\ \text{IdExt}}{}\ \implies\ \text{Elim}}{\cfrac{\cfrac{\cfrac{..; f, g, x; ..; f((X \to \underline{Y})[eq_X, eq_{\underline{Y}}])g \vdash_d fx(eq_{\underline{Y}})gx}{..; f, g, x; ..; f((X \to \underline{Y})[eq_X, eq_{\underline{Y}}])g \vdash_d fx =_{\underline{Y}} gx}\ \text{IdExt}}{\cfrac{..; f, g; ..; f((X \to \underline{Y})[eq_X, eq_{\underline{Y}}])g \vdash_d (\lambda x : X.fx) =_{X \to \underline{Y}} (\lambda x : X.gx)}{..; f, g; ..; f((X \to \underline{Y})[eq_X, eq_{\underline{Y}}])g \vdash_d f =_{X \to \underline{Y}} g}\ \lambda\eta}\ \lambda\ \text{cong}}{\cfrac{..; f, g; .. \vdash_d f((X \to \underline{Y})[eq_X, eq_{\underline{Y}}])g \implies f =_{X \to \underline{Y}} g}{... \vdash_d \forall(f, g : X \to \underline{Y}).f((X \to \underline{Y})[eq_X, eq_{\underline{Y}}])g \implies f =_{X \to \underline{Y}} g}\ \text{Intros}}\ \text{Intros}}}$$

2.7.4 Identity Function

$$\cfrac{\cfrac{?}{X; f : \forall X.X \to FX, x : X; \cdot; \cdot \vdash_d f[X]x =_{FX} ret\ x}{}}{\cdot; f : \forall X.X \to FX; \cdot; \cdot \vdash_d \forall X.\forall(x : X).f[X]x =_{FX} ret\ x}\ \text{Intro}$$

2.7.5 Church Encodings

Unit Forget the built in Unit type for now. Note that we only have the compuational function type in this language.

$$Unit := \forall X.X \to FX$$
$$\mathbf{1} : Unit$$
$$\mathbf{1} = \Lambda X.\lambda(x : X).\ \text{ret}\ x$$

Given

$$f : \forall X.X \to FX$$

by η

$$f = \Lambda X.\lambda(x : X).f[X]x$$

Pick a relation on FX,

$$R := X; x : X; \cdot \vdash_r (a : FX, b : FX).\ \text{ret}\ x =_{FX} b$$

What does parametricity say for the type $\forall X.X \to FX$?

$$\forall(t : (\forall X, X \to FX)).\forall Y, Z, R : Rel_v[Y, Z].t[Y]((X \to FX)[R])t[Z]$$

$((X \to FX)[R])$ Substitute the relation in for type variables.

$$(X \to FX)[R] =$$
$$= X[R] \to (FX)[R]$$
$$= X[R] \to \textcolor{red}{?}$$

$$
\cfrac{
  \cfrac{
    \cfrac{
      \cfrac{
        \cfrac{?}{Unit, X; \mathbf{1}, f, x; \cdot; \cdot \vdash_d \forall X.\forall(x : X).\ \text{ret}\ x =_{FX} f[X]x} \qquad \cfrac{}{Unit, X \vdash X}\ \forall\ \text{Elim}
      }{Unit, X; \mathbf{1}, f, x; \cdot; \cdot \vdash_d \forall(x : X).\ \text{ret}\ x =_{FX} f[X]x}
    }{Unit, X; \mathbf{1}, f, x; \cdot; \cdot \vdash_d\ \text{ret}\ x =_{FX} f[X]x \qquad \cfrac{\cfrac{}{..\vdash_v x : X}\ \text{Var}}{}\ \forall\ \text{Elim}}
  }{Unit; \mathbf{1}, f; \cdot; \cdot \vdash_d \Lambda X.\lambda(x : X).\ \text{ret}\ x =_{Unit} \Lambda X.\lambda(x : X).f[X]x}\ \text{cong},\ \text{Def},\ \eta
  }{Unit; \mathbf{1}, f; \cdot; \cdot \vdash_d \mathbf{1} =_{Unit} f}
}{Unit; \mathbf{1}; \cdot; \cdot \vdash_d \forall(f : Unit).\mathbf{1} =_{Unit} f}\ \text{Intro}
$$

2.7.6   OSum Free Theorems

Looking for free theorems for types containing our separating connectives, OSum, and Case. From the gradual parametricity paper: given

$$\vdash M : \forall^{\nu} X.? \to X$$

and $\vdash V : ?$ then

$$\text{unseal}_X (M\{X \cong A\}V)\text{true}$$

either diverges or errors.
In CBPV OSum:

$$\vdash_c M : \forall X.\text{Case}X \multimap (\text{OSum} \to FX)$$

should be uninhabited. If error $\mho$ was added to the language, then

$$A; \sigma : \text{Case}A * d : \text{OSum} \vdash_c (M[A]@\sigma)d : FX$$

should always error.

$$A; \sigma : \text{Case}A * d : \text{OSum}; \cdot; \cdot \vdash_d \forall(M : X.\text{Case}X \multimap (\text{OSum} \to FX)).(M[A]@\sigma)d =_{FX} \mho$$

Seems like we have to state this property with the context loaded since we dont have a freshenss quantifier. Would we want something like?:

$$\vdash_d \forall A.\mathcal{N}(\sigma : \text{Case A}).\forall(d : \text{OSum})\forall(M : X.\text{Case}X \multimap (\text{OSum} \to FX)).(M[A]@\sigma)d =_{FX} \mho$$

in Fresh Logic [CITE], Gabbay decomposes $\mathcal{N}$ into

$$\mathcal{N}a.\phi(a) := \exists S \in \text{Fin}\mathbf{A}.\forall a \notin S.\phi(a)$$
